

Optimum Design of Statistical Experiments

Friedrich PUKELSHEIM, *University of Augsburg, Germany*

Abstract: The optimality theory of the design of statistical experiments builds on the linear statistical model, involving results from statistics, linear algebra, and convex analysis. We will survey the grand lines of thought. When putting the theoretical results to practical use, some adjustments, as well as extensions, are called for. We will outline such practical issues by discussing a particular example which uses a designed experiment for quality improvement of a manufacturing process.
